## **Colebrook Bosson Saunders presents AVALL at Orgatec 2008**

The AVALL system was developed to humanise users' and installers' experience of video conferencing and digital presentations. This relatively new technology, increasingly used in all sorts of work environments, is often feared by users.

AVALL is a system designed as an interface to integrate the product (the AV technology) with people and facilitate the product being used in a more effective and ergonomic way.

The unit is shown here in Colebrook Bosson Saunders' London Showroom where it is used to communicate with CBS staff in the company's New York Showroom.

The unit is designed with integrated hardware storage to hide all the electronics seamlessly inside the column. It's the installer's perfect solution and presents the user with a simple clean structure enabling them to focus purely on the screen presentation. This enables the initial installation of wiring and any future maintenance or adaptations to be easily managed.

CBS incorporated into the design of AVALL cover panels that are easily detachable. These significantly help the user with both integration of other devices and also maintenance of the technology contained.

The full AVALL range will be on show at Stand C-040 at this year's Orgatec in Cologne.

ENDS
